

Utopias are envisioned societies where human beings live a best possible life. An Engels-Inspired utopia will have a highly developed technologically driven global society that is completely devoid of capitalism with minimal if any government. I will speak about what food services will look like in an Engels non-capitalist technologically driven future. Eventually, robots and artificial intelligence will take over food services. Automated robots and systems that are programmed with simple food recipe instructions can make delicious food at a faster speed than a human can. Artificial intelligence can be used to program systems/robots to copy a chef's procedure and even style for food recipes. The same thing can be done for servers in the restaurant industry. Robots and systems that bring food automatically to tables will get rid of human errors, such as, dropping plates/glass and forgetting orders. Automated machines can also work on a farm much faster than farmers and animals combined. Animals and farms have to sleep, but machines don't. Machines/robots can plow and harvest crops 24 hours a day and they can harvest at a quicker rate. As a result, technology will replace almost all human labor. Humans won't have to worry about doing physical tough labor and they can focus more on conducting business. People are usually paid because of the effort or the labor they put into work. If we have automated systems that do the labor for us, there wouldn't be much of a need for capitalism. Companies and businesses wouldn't have to worry about labor cost and paying people since they have the technology to do it for them. In turn, everything that a company or business sells would be very cheap or free. If a restaurant didn't have to pay any staff, they can afford to sell their food for a much cheaper price. A restaurant also wouldn't have to pay much for groceries since the farmers would sell it for a cheap price. The farmers would sell it for a cheap price because they don't have to put in any labor or hire other farmers. In addition, there will be fewer government regulations because of less human error. Automated systems can follow sanitary rules much better and alcohol rules with minors. Automated systems won't have human error in contaminating food or selling alcohol illegally. This way, there will be less governmental health checks and certificate renewals. Once the government sets certain laws, they don't have to keep doing so many checks to uphold it or to change the law to accommodate for further human errors. Food services influenced by an Engels Utopia can be reached with the use of artificial intelligence and machinery, elimination of capitalism, and the reduction of government regulation.
